HTML & CSS IN WEB DEVELOPMENT

Question 1: The Bio Profile Card

- **HTML Task:** Create a div container representing a profile card. Include an image (), a heading (<h1>) for a name, a paragraph (<p>) for a short biography, and an anchor tag (<a>) styled as a button linking to a professional profile.

- **CSS Task:**
 - Set the card's width to 300px and center it on the screen using margins.
 - Apply a 1px solid #ddd border, a 8px border-radius, and a subtle box-shadow.
 - Add 20px of inner padding to the card so the content doesn't touch the borders.

Question 2: The Styled Data Table

- **HTML Task:** Build a 4-row, 3-column table showing a list of products, their prices, and stock status. Use proper semantic tags: `<table>`, `<thead>`, `<tbody>`, `<tr>`, `<th>`, and `<td>`.
- **CSS Task:**
 - Collapse the borders using `border-collapse: collapse;`.
 - Add 12px of padding to all table cells.
 - Implement alternating row background colors (zebra striping) using the `:nth-child(even)` pseudo-class.
 - Align text in header cells to the left and color the header background dark blue with white text.

Question 3: Semantic Survey Form

- **HTML Task:** Create a comprehensive user feedback form using a `<form>` element. Include:
 - A text input for Name.
 - An email input with a placeholder.
 - A dropdown menu (`<select>`) for choosing a rating (1 to 5).
 - A group of radio buttons for "Would you recommend us?" (Yes/No).
 - A submit button.
- **CSS Task:**
 - Make all text inputs take up 100% of their container's width.
 - Use vertical spacing (`margin-bottom`) to cleanly separate each form control.
 - Style the focus state (`input:focus`) to display a distinct colored border and remove the default outline.

Question 4: Flexbox Navigation Bar

- **HTML Task:** Construct a standard header navigation using `<header>`, `<nav>`, and an unordered list (`<ul>`) with four navigation links.
- **CSS Task:**
 - Use **CSS Flexbox** (`display: flex;`) on the `<ul>` to align the items horizontally.
 - Distribute space evenly between or around the items using `justify-content`.
 - Remove default list bullet points (`list-style: none;`) and default browser padding/margins.
 - Add a hover effect to change the text color and add an underline when a user hovers over a link.
